NARRATOR: Medical Technology Victoria – known as MedTechVic – is supporting and connecting individuals and organisations across the assistive and medical device sector in Victoria, ensuring rapid clinical and technical prototyping and manufacturing of new ideas.

Our goal is to bring together individuals with lived disability, their carers, allied health and clinical professionals, engineers, designers, and industry to co-create products and services that enhance lives.

MedTechVic is deeply connected across clinical, industrial, service and community sectors. Our partners, alongside our researchers, have access to state-of-the-art facilities, including our LivingAT facility and Volumetric Capture – or VolCap – studio.

Our LivingAT facility is a fully accessible space utilised for development and prototyping of enabling technology, products and services. The space has been carefully crafted to allow end-users living with disability to fully contribute to the creative problem-solving process and help create meaningful outcomes.

Our VolCap studio is pioneering the research applications of an advanced technology, usually used by commercial filmmakers and creators. It has a unique capacity for capturing human movement and shape, with the potential to revolutionize approaches to medical devices and assessment.

An inclusive future for medical innovation is here, driven by those who need it most.
